forking the repository

Head to iamdonovan/egm722, which is the remote repository location for the materials for this module. If you are not currently logged in, do so now. Click the Fork button in the upper right-hand corner of the window:
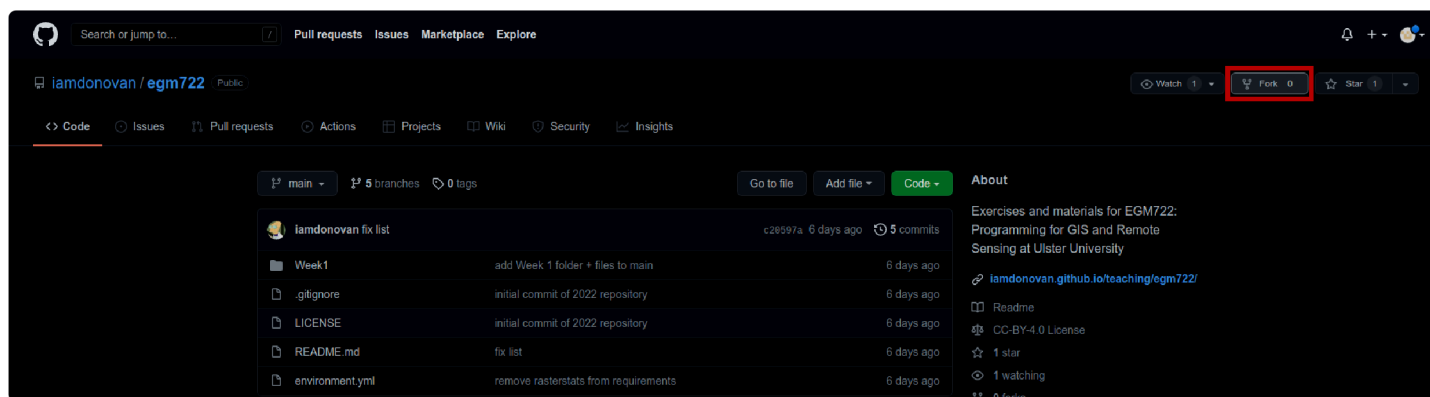

This will create a fork of the repository – it will copy the entire repository over to your account. On this page, make sure that you uncheck **Copy the main branch only** before clicking **Create fork**:
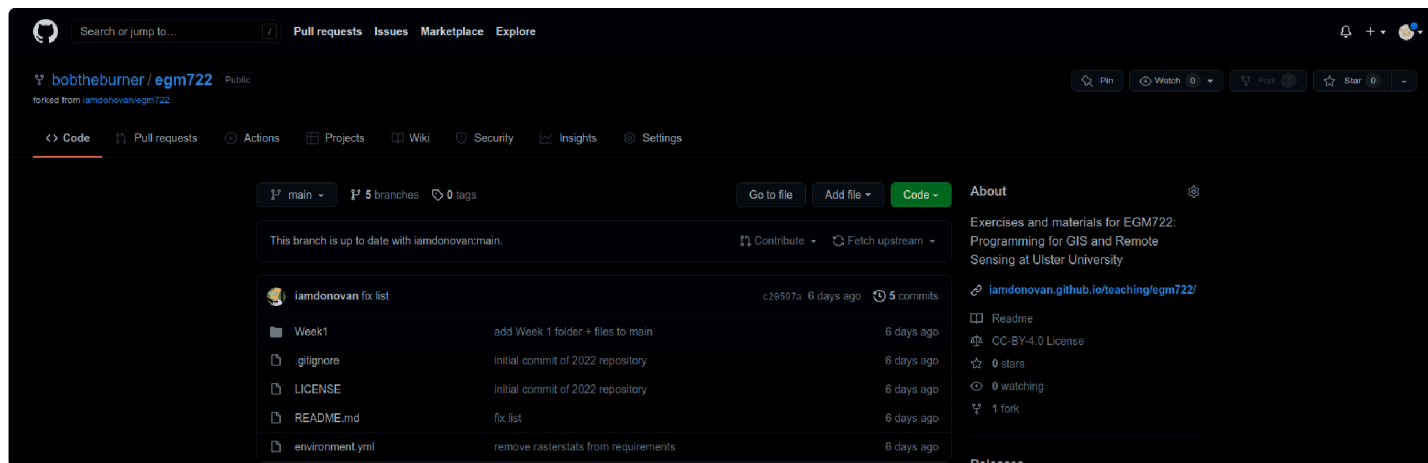

Skip to main content
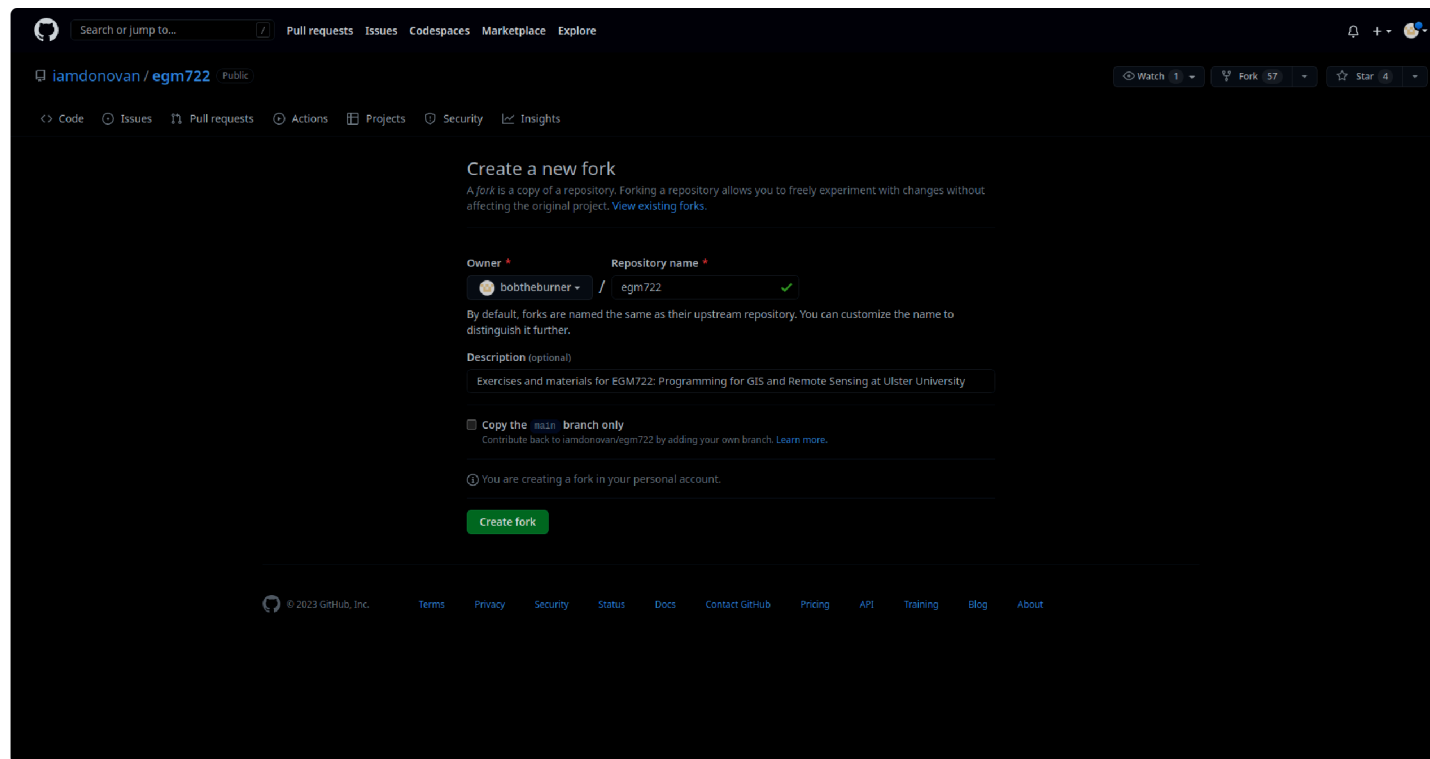

> ⚠️ **Warning**
>
> If you do not uncheck this button, **don't panic**. You will still be able to use the other branches, but you will have to check out each branch from the **upstream** repository, rather than your own remote repository.

After a minute, you should see the following:

<u>Skip to main content</u>

Congratulations! You have created your first fork! Make a note of the repository URL (for the example above, it is

 bobtheburner/egm722).
